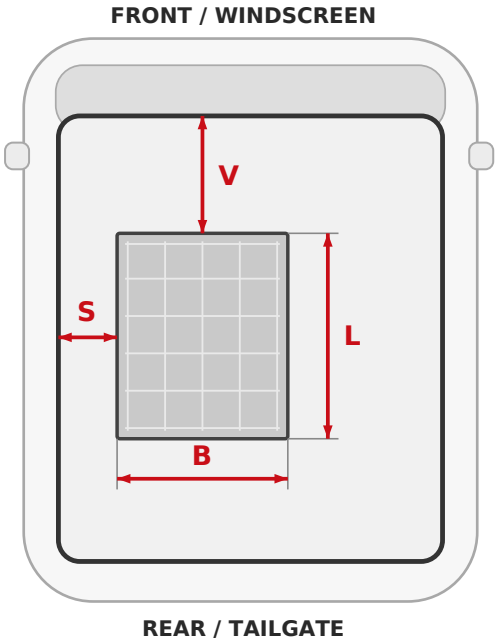
Measure your solar panels

For a solar window, we need the size and position of each panel. Use cm for all measurements.
You do not need to measure the entire pop-top roof.

Which edges do I measure from?



B and L • Panel size

Measure across the outside, including the frame.
B is across the vehicle; L is along it.

V and S • Clear distance

Start the tape at the outer edge of the pop-top roof shell (dark outline). Measure up to the panel frame. The light grey vehicle edge is not part of the measurement.

You can also start from the rear or right edge. Tick the edges you used below. Left and right are always as seen facing forward.

Panel 1

B Width _____ cm **L Length** _____ cm

Lengthwise gap	☐ from front	☐ from rear	_____ cm
Side gap	☐ from left	☐ from right	_____ cm

Panel 2 (if fitted)

B Width _____ cm **L Length** _____ cm

Lengthwise gap	☐ from front	☐ from rear	_____ cm
Side gap	☐ from left	☐ from right	_____ cm

For panel 2, choose the roof-edge position option in the form.
You can then enter the measurements directly.

Enter your measurements in the form.
A roof photo helps if we have questions.
